

A “Coherent” Proof of Mac Lane’s Coherence Theorem

Luke Trujillo

November 24, 2020

Definition of a Category

A **category** \mathcal{C} is mathematical dataset.

It consists of:

- ▶ a collection of “things” which we call **objects** and denote them as A, B, C, \dots
- ▶ a collection of “arrows” *between* objects, which we call **morphisms** and denote them as $f : A \rightarrow B$
- ▶ a **composition** operator \circ acting on morphisms.

such that a few rules hold. Details are not important, and we demonstrate a few examples.

Some Familiar Categories

Vector spaces over a field k form a category called \mathbf{Vect}_k .

Objects. All vector spaces V over k .

Morphisms. Linear transformations $T : V \rightarrow W$.

Some Familiar Categories

Topological spaces form a category called **Top**.

Objects. All topological spaces X .

Morphisms. Continuous functions $\varphi : X \rightarrow Y$.

Why Category Theory?

Categories were invented as a tool and a language. They're extremely useful and indispensable to

- ▶ Homotopy Theory, which utilize various notions of an **operad**

$$\lambda_A : I \otimes A \xrightarrow{\sim} A$$

$$\rho_A : A \otimes I \xrightarrow{\sim} A$$

Monoidal Categories

These are all what motivate the following definition.

A **monoidal category** $\mathcal{M} = (\mathcal{M}, \otimes, I)$ is a category \mathcal{M} equipped with a “product” $\otimes : \mathcal{M} \times \mathcal{M} \rightarrow \mathcal{M}$, an identity object I , and three natural isomorphisms

$$\begin{aligned}\alpha_{A,B,C} : A \otimes (B \otimes C) &\xrightarrow{\sim} (A \otimes B) \otimes C && \textbf{(Associator)} \\ \lambda_A : I \otimes A &\xrightarrow{\sim} A && \textbf{(Left Unit)} \\ \rho_A : A \otimes I &\xrightarrow{\sim} A && \textbf{(Right Unit)}\end{aligned}$$

subject to some **coherence conditions**.

Monoidal Categories

MLC Theorem

Thesis Goal

$$\begin{array}{ccc} A \otimes (I \otimes B) & \xrightarrow{\alpha_{A,I,B}} & (A \otimes I) \otimes B \\ & \searrow 1_A \otimes \lambda_B \quad \swarrow \rho_A \otimes 1_B & \\ & A \otimes B & \end{array}$$

Monoidal Category Axioms

Coherence Condition #2. For all objects A, B, C, D in \mathcal{M} , the diagram commutes.

$$\begin{array}{ccc} & (A \otimes B) \otimes (C \otimes D) & \\ \alpha_{A,B,C \otimes D} \nearrow & & \searrow \alpha_{A \otimes B,C,D} \\ A \otimes (B \otimes (C \otimes D)) & & ((A \otimes B) \otimes C) \otimes D \\ \downarrow 1_A \otimes \alpha_{B,C,D} & & \uparrow \alpha_{A,B,C} \otimes 1_D \\ A \otimes ((B \otimes C) \otimes D) & \xrightarrow{\alpha_{A,B \otimes C,D}} & (A \otimes (B \otimes C)) \otimes D \end{array}$$

Q: Why the Axioms?

A: We want “coherence,” a property we describe as follows.

Coherence for Four Objects

- ▶ Commutativity of the pentagon allows me, up to isomorphism, to unambiguously write “ $A \otimes B \otimes C \otimes D$ ”.
- ▶ **Q:** Okay, awesome! How about the 14 objects generated by A, B, C, D, E ? Are they all isomorphic? Can we also unambiguously write “ $A \otimes B \otimes C \otimes D \otimes E$ ”?

Solution: Mac Lane's Coherence Theorem

- ▶ Mac Lane's Coherence Theorem address all of our concerns and guarantees “coherence.”
- ▶ Mac Lane defined the monoidal category axioms to be the minimal requirements to guarantee his theorem to be true.

Theorem (Mac Lane, 1970)

Let $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ be a monoidal category. For each object A , there exists a strict monoidal functor $\Psi_A : \mathcal{W} \rightarrow \mathcal{M}$, where \mathcal{W} is the free monoidal category on a single object.

Solution: Mac Lane's Coherence Theorem

- ▶ Mac Lane's Coherence Theorem address all of our concerns and guarantees “coherence.”
- ▶ Mac Lane defined the monoidal category axioms to be the minimal requirements to guarantee his theorem to be true.

Theorem (Mac Lane, 1970)

Let $(\mathcal{M}, \otimes, I, \alpha, \lambda, \rho)$ be a monoidal category. For each object A , there exists a strict monoidal functor $\Psi_A : \mathcal{W} \rightarrow \mathcal{M}$, where \mathcal{W} is the free monoidal category on a single object.

Rough Translation:

All diagrams built in a canonical way from α, λ, ρ commute.

Proof? Oh no...

Mac Lane offers a proof outline in his famous *Categories for the Working Mathematician*. However, it is somewhat confusingly written, so the next best option is to consult other sources. This leads us to the problem:
